

AGEDIS online!

AGEDIS*, a project funded by the European Community, is presented in the internet since the beginning of December. You are invited to find all information about the research project as well as the project partners in Europe and Israel on www.agedis.de.

The project aims at the development of new methods and tools for automating software tests to a much greater extent than possible today. AGEDIS will develop methods which enable test cases and test data to be generated directly from specifications and formal models. By October 2003, appropriate tools and training programs will be made available to the European software industry.

It is planned to make the web-site a central meeting point of the international software tester community. It is equally addressed to software testers as well as testtool developers and the test management staff. Services like current news and specific discussion groups have been established. In addition, an increasing list of literature and test-oriented link lists are regarded as important elements.
